

Management Actions Workshop Floodplain Management

ERRATA

For **Management Action 080**, “Eliminate subsidies for structures that are repetitively damaged”:

1. The **Problem** should be *“There are instances where owners of property within the floodplain have accumulated insurance claim reimbursements equal to or greater than the value of the structure for repeated flood damages.”*

For **Management Action 026**, “Manage municipal stormwater to provide regional or systemwide flood benefits,” the **Methodology** field should display:

1. “Stormwater management is governed and implemented by municipalities and other local agencies. There are opportunities to coordinate local stormwater management with regional flood operations and to explore the treatment and reuse of stormwater. There is a need to assess runoff and the hydrology of basins, compare the anticipated volumes, timing, and velocities with channel capacities and develop a landscape that accommodates the expected flows in a manner that minimizes the risk to communities and ecosystems. Examples of implementation include replacement of concrete/pavement or other hardscape surfaces with vegetative surfaces to reduce runoff and increase infiltration; use of diversion channels to collect excess surface water and convey it to a waterway or detention basin for infiltration; use of vegetated waterways to reduce erosion, improve water quality, support riparian habitat, and improve aquatic species migration and breeding; use of terracing to reduce the volume and velocity of runoff from sloped land; diverting floodwaters from recharge facilities to in-stream flows to improve water supply and quality.
